Treatment of Acne and Pre-Malignant Lesions

Policy Number: HS-258

APPLICATION STATEMENT

The application of the Clinical Coverage Guideline is subject to the benefit determinations set forth by the Centers for Medicare and Medicaid Services (CMS) National and Local Coverage Determinations and state-specific Medicaid mandates, if any.

DISCLAIMER

The Clinical Coverage Guideline (CCG) is intended to supplement certain standard WellCare benefit plans and aid in administering benefits. Federal and state law, contract language, etc. take precedence over the CCG (e.g., Centers for Medicare and Medicaid Services [CMS] National Coverage Determinations [NCDs], Local Coverage Determinations [LCDs] or other published documents). The terms of a member’s particular Benefit Plan, Evidence of Coverage, Certificate of Coverage, etc., may differ significantly from this Coverage Position. For example, a member’s benefit plan may contain specific exclusions related to the topic addressed in the CCG. Additionally, CCGs relate exclusively to the administration of health benefit plans and are NOT recommendations for treatment, nor should they be used as treatment guidelines. Providers are responsible for the treatment and recommendations provided to the member. The application of the CCG is subject to the benefit determinations set forth by the Centers for Medicare and Medicaid Services (CMS) National and Local Coverage Determinations, and any state-specific Medicaid mandates. Links are current at time of approval by the Medical Policy Committee (MPC) and are subject to change. Lines of business are also subject to change without notice and are noted on www.wellcare.com. Guidelines are also available on the site by selecting the Provider tab, then “Tools” and “Clinical Guidelines”.

BACKGROUND

Acne vulgaris (acne) is the formation of comedones, papules, pustules, nodules, and/or cysts as a result of obstruction and inflammation of pilosebaceous units (hair follicles and their accompanying sebaceous gland). It most often affects adolescents. Diagnosis is by examination. Treatment is a variety of topical and systemic agents intended to reduce sebum production, bacterial counts, and inflammation and to normalize keratinization.1

Acne of any severity usually remits spontaneously by the early to mid-20s, but a substantial minority of patients, usually women, may have acne into their 40s; options for treatment may be limited because of childbearing. Many adults occasionally develop mild, isolated acne lesions. Non-inflammatory and mild inflammatory acne usually heals without scars. Moderate to severe inflammatory acne heals but often leaves scarring. Scarring is not only physical; acne may be a huge emotional stressor for adolescents who may withdraw, using the acne as an excuse to avoid difficult personal adjustments. Supportive counseling for patients and parents may be indicated in severe cases.1,2 Acne that does not respond to topical agents or medication (pharmaceutical or over the counter [OTC]) may require one of several procedures to treat acne including, but not limited to:

- **Acne surgery** is the physical removal of the material forming a blockage and causing a lesion. Surgical procedures include, but are not limited to, excision of cysts or pustules, incision and drainage, punch debridement or unroofing of nodules or sinuses.

- **Chemical peels or exfoliation** involves a chemical solution that is applied to the skin; this results in a destruction of the superficial layer, allowing a new layer of skin regeneration.

- **Cryotherapy (or cryosurgery)** uses liquids (e.g., liquid nitrogen, acetone slush, carbon dioxide [CO2]) to reduce the skin temperature to very low levels causing the skin to peel and allowing for the removal of whiteheads and/or blackheads.
• **Dermabrasion** is a specialized instrument used to “sand” the skin to remove the epidermal surface in order to improve contour. **Microdermabrasion** involves the use of abrasive crystals to remove the dead epidermal cells from the face.

• **Light therapy (or Phototherapy)** involves the exposure of skin to ultraviolet or infrared light (e.g., ultraviolet A or B; red, blue, or red-blue light; Psoralens ultraviolet actinotherapy [PUVA]), lasers, pulsed dye laser and photodynamic therapy [PDT]) have been investigated for the treatment of acne vulgaris.

• **Photodynamic Therapy (PDT)** involves the application of a topical agent (e.g., 5-aminolevulinic acid [Levulan]) which is activated by light. The energy from the light causes the release of oxygen molecules, which is reported to have the biologic effect of killing the bacteria responsible for acne.

---

**POSITION STATEMENT**

**Applicable To:**

- Medicaid - KY

**Global Exclusions**

In addition to the items noted above, the following are considered experimental and investigational:

- Scar injection
- Cosmetic procedures (used alone or in combination with other treatment) (e.g., dermaplaning, collagen injections, polymethyl-methacrylate microspheres with collagen [e.g., Artecoll®, Rofil Medical USA], gelatin matrix implant, hyaluronic acid derivative fillers [e.g., Restylane®, Q-Med Inc.], autologous fat replacement, punch biopsy elevation, punch excision with or without full-thickness skin graft replacement, electrodesiccation, laser dermablation/laser abrasion using carbon dioxide or erbium:YAG lasers with or without follow-up cryotherapy)

**Exclusions**

The following are considered experimental and investigational due to a lack of established efficacy:

- Treatment using cryoslush therapy (solid CO2 mixed with acetone) and liquid nitrogen
- Intraleisional injection of steroids (includes, but is not limited to, treatment for inflammatory nodulo-cystic acne, acne conglobate, acne fulminans, and pyoderma faciale)
- Treatments for acne scarring, melasma, skin wrinkling or lentigines cosmetic

**Coverage**

Acne surgery is considered medically necessary when one of the following criteria are met:

1. Member is having one of the following acne surgery procedures:
   - Marsupialization; OR,
   - Opening or removal of multiple milia, comedones, cysts, and/or pustules
   AND,
2. Member has documented failure of the initial medication treatments (e.g. oral contraceptive hormone therapy, antibiotics, retinoids) or documented development of side effects of initial medication treatments.

**Chemical Peels**

**Exclusions**

Chemical peels are not considered medically necessary for the following due to a lack of established efficacy:

- Treatment of acne vulgaris
- Treatment of non-malignant (simple) lesions
• For active acne
• For acne scarring, melasma, skin wrinkling or lentigines cosmetic
• For all other indications not listed below.

Coverage

Medium and deep chemical peels are considered medically necessary when the following criteria are met:
1. Treatment is for actinic keratoses and other pre-malignant skin lesions; AND,
2. Member has >15 lesions making it, such that it becomes unreasonable to treat each specific lesion; AND,
3. Member has failed to adequately respond to treatment with topical 5-FU or imiquimod (unless contraindicated).

Dermabrasion and Microdermabrasion

Exclusions

Dermabrasion is considered experimental and investigational for all other indications due to a lack of established efficacy. This includes, but is not limited to dyschromias, keloids, melasma, and vitiligo.

Coverage

Dermabrasion is considered medically necessary using the conventional method of controlled surgical scraping (dermaplaning) or carbon dioxide (CO2) laser for the removal of superficial basal cell carcinomas and precancerous actinic keratosis when the following are met:
• Conventional methods of removal such as cryotherapy, curettage, and excision, are impractical due to the number and distribution of the lesions; AND,
• Member has failed a trial of 5-fluorouracil (5-FU) (Efudex) or imiquimod (Aldara), unless contraindicated.

CODING

Covered CPT®* Codes
10040 Acne surgery
15780 Dermabrasion; total face (eg, for acne scarring, fine wrinkling, rhytids, general keratosis)
15781 Dermabrasion; segmental face
15782 Dermabrasion; regional, other than face
15783 Dermabrasion; superficial, any site (eg, tattoo removal)
15788 Chemical peel, facial; epidermal
15789 Chemical peel, dermal
15792 Chemical peel, nonfacial; epidermal
15793 Chemical peel, dermal
17360 Chemical exfoliation for acne (eg, acne paste, acid)

Covered ICD-10-CM Diagnosis Codes
L91.0 Hypertrophic scar
L70.2 Acne varioliformis
L70.0 Acne vulgaris
L70.1 Acne conglobata
L70.3 Acne tropica
L70.4 Infantile acne
L70.5 Acne excoriée des jeunes filles
L70.8 Other acne
L70.9 Acne, unspecified

Clinical Coverage Guideline
L73.0 Acne keloid
L81.9 Disorder of pigmentation, unspecified
L57.3 Poikiloderm of Civatte
L81.0 Postinflammatory hyperpigmentation
L81.1 Chloasma
L81.2 Freckles
L81.3 Cafe au lait spots
L81.4 Other melanin hyperpigmentation
L81.5 Leukoderma, not elsewhere classified
L81.6 Other disorders of diminished melanin formation
L81.7 Pigmented purpuric dermatosis
L81.8 Other specified disorders of pigmentation
L90.5 Scar conditions and fibrosis of skin

Coding information is provided for informational purposes only. The inclusion or omission of a CPT, HCPCS, or ICD-10 code does not imply member coverage or provider reimbursement. Consult the member's benefits that are in place at time of service to determine coverage (or non-coverage) as well as applicable federal/state laws.
